

HW 1 Answer Key

ATSC 201 Fall 2023

Chapter 1: A1e, A3e, A5e, A6e, A9e, A14e, A15e

Total mark out of 25

A1e)

(4 marks)

Find the wind direction (degrees) and speed (m/s), given the (U,V) components: d) (8,0) knots

Given: U = 8 knots
 V = 0 knots

Find: alpha (wind direction) M (wind speed)

Using eq. 1.1:

$$M = (U^2 + V^2)^{0.5}$$

Using eq. 1.2a:

$$\alpha = 90\text{deg} - (360\text{deg}/C) * \arctan(V/U) + \alpha_0$$

$$C = 360 \text{ deg}$$

if $U > 0$ $\alpha_0 = 180 \text{ deg}$

$$M = 8 \text{ knots}$$

$$= 4.11556507 \text{ m/s}$$

M = 4.12 m/s
alpha = 270.00 deg

Checks: Units ok. Physics ok.

Discussion: The wind is coming from the W with a magnitude of 4.12 m/s.

A3e)

(3 marks)

Convert the following UTC time to local time in your own time zone: e) 12:45

Given: 12:45 UTC

Find: local time

Using eqs. from Table 1-1

$$DT = UTC - \text{beta}$$

HW 1 Answer Key

$$ST = UTC - \alpha$$

Vancouver's time zone is "U" (Pacific)

$$\beta = 7:00 \text{ PDT}$$

$$\alpha = 8:00 \text{ PST}$$

Currently, local time is PDT.

DT =	5:45 PDT
for partial marks: ST =	4:45 PST

Checks: Units ok.

Discussion: Vancouver is currently in Pacific Daylight Time, so it is presently 7 hours behind UTC time.

A5e)
(2.5 marks)

Find the pressure in kPa at the following heights above sea level, assuming an average $T = 250\text{K}$: d) 25 km.

Given: $z \text{ (m)} = 30,000 \text{ ft}$ $" = "$ 9144

$$\text{avg } T = 250 \text{ K}$$

Find: P ? kPa

Using eq. 1.9a:

$$P = P_o * e^{-(a/T)*z}$$

where: $P_o = 101.3250 \text{ kPa}$

$$a = 0.0342 \text{ K/m}$$

P =	29.0 kPa
------------	-----------------

Checks: Units ok. Physics ok.

Discussion: At 30,000 ft \approx 9km above sea level, the pressure is reduced to 29 kPa

HW 1 Answer Key

A6e)
(3 marks)

Use the definition of pressure as a force per unit area, and consider a column of air that is above a horizontal area of 1 square meter. What is the mass of air in that column: e) Between pressure levels 100 and 20 kPa

Given: $P_{\text{bottom}} = 100 \text{ kPa}$
 $P_{\text{top}} = 20 \text{ kPa}$
 $A = 1 \text{ m}^2$

Find: $\Delta m = ? \text{ kg}$
mass of air between P_{bottom} and P_{top}

Using eq. 1.11:

$$\Delta m = (A/g) * (P_{\text{bottom}} - P_{\text{top}}) \quad \text{where } g = 9.81 \text{ m/s}^2$$

Convert P_{bottom} (kPa) and P_{top} (kPa) to P_{bottom} (Pa) and P_{top} (Pa):

$P_{\text{bottom}} = 100000 \text{ Pa}$
 $P_{\text{top}} = 20000 \text{ Pa}$

$\Delta m = 8154.94 \text{ kg}$

Checks: Units ok. Physics ok.

Discussion: This is a calculation of the air mass between 100 and 20 kPa pressure that exists over 1 square meter of area.

A9e)
(2.5 marks)

Convert the following temperatures: e) $303 \text{ K} = ?^\circ\text{C}$

Given: $T_{\text{K}} = 303 \text{ K}$

Find: $T_{\text{C}} = ?^\circ\text{C}$

Using equation 1.7b:

$$T_{\text{C}} = T_{\text{K}} - 273.15$$

$T_{\text{F}} = 29.85^\circ\text{C}$

Checks: Units ok.

Discussion: 29.85°C should be one of the hottest days in the summer in Vancouver

HW 1 Answer Key

A14e)

(4.5 marks)

What is the geopotential height and geopotential, given the geometric height? e) 500m

Given: $H = 500 \text{ m}$

Find: $z = ? \text{ m}$
 $\Phi = ? \text{ m}^2/\text{s}^2$

Using eq. 1.14b:

$$z = R_o * H / (R_o - H)$$

where the radius of the Earth, $R_o = 6356.766 \text{ km} = 6,356,766 \text{ m}$.

$$R_o = 6356766 \text{ m}$$

And using eq. 1.15:

$$\Phi = g * H \quad \text{where } g = 9.81 \text{ m/s}^2$$

$$H = 499.960675 \text{ m}$$

$z =$	499.96 m
$\Phi =$	4904.61 m²/s²

Checks: Units ok. Physics ok.

Discussion: The difference between the geometric height and the geopotential height is negligible at 500ft.

A15e)

(5.5 marks)

What is the standard atmospheric temperature, pressure, and density at the following geopotential height: e) 200m ?

Given: $H = 200 \text{ m}$

0.2 km

Find: $T = ? \text{ degC}$

HW 1 Answer Key

$$\begin{array}{lll} P = & ? & \text{kPa} \\ \rho = & ? & \text{kg/m}^3 \end{array}$$

Using eqs. 1.16 for $H < 11\text{km}$:

$$T = 288.15 - 6.5 \cdot H$$

$T =$	286.85 K 13.70 degC
-------	--------------------------------------

Using eq. 1.17 for $H < 11\text{km}$:

$$P = 101.325 \cdot (288.15/T)^{-5.255877}$$

$P =$	98.95 kPa
-------	------------------

Using and rearranging eq. 1.18:

$$\rho = P / R_d \cdot T$$

where $R_d = 0.287053 \text{ kPa} \cdot \text{m}^3 / \text{K} \cdot \text{kg}$
gas constant for dry air

$\rho =$	1.20165096 kg/m³
----------	------------------------------------

Checks: Units ok. Physics ok.

Discussion:

At 200m, the air not noticeably colder
and has a similar pressure
